Abstract

There is a matrix model corresponding to a scalar field theory on noncommutative spaces called Grosse-Wulkenhaar model ($\Phi^4$ matrix model), which is renormalizable by adding a harmonic oscillator potential to scalar $\Phi^4$ theory on Moyal spaces. There are more unknowns in $\Phi^4$ matrix model than in $\Phi^3$ matrix model, for example, in terms of integrability. We then construct a one-matrix model ($\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model) with multiple potentials, which is a combination of a 3-point interaction and a 4-point interaction, where the 3-point interaction of $\Phi^3$ is multiplied by some positive definite diagonal matrix $M$. This model is solvable due to the effect of this $M$. In particular, the connected $\sum_{i=1}^n N_i$-point function $G_{|a_1^i \cdots a_{N_i}^i|}$ of $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model is studied in detail. This $\sum_{i=1}^B N_i$-point function can be interpreted geometrically and corresponds to the sum over all Feynman diagrams (ribbon graphs) drawn on Riemann surfaces with $B$ boundaries (punctures). Each $|a_1^i \cdots a_{N_i}^i|$ represents $N_i$ external lines coming from the $i$-th boundary (puncture) in each Feynman diagram. First, we construct Feynman rules for $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model and calculate perturbative expansions of some multipoint functions in ordinary methods. Second, we calculate the path integral of the partition function $Z[J]$ and use the result to compute exact solutions for 1-point function $G_{|a|}$ with 1-boundary, 2-point function $G_{|ab|}$ with 1-boundary, 2-point function $G_{|a|b}$ with 2-boundaries, and $n$-point function $G_{|a_1^1 \cdots a_n^n|}$ with $n$-boundaries. They include contributions from Feynman diagrams corresponding to nonplanar Feynman diagrams or higher genus surfaces.

1 Introduction

1.1 Overview

The purposes of this paper are to construct a perturbative theory of $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model to compute connected multipoint correlation functions and to give their exact solutions by direct calculations of path integrals. Roughly speaking, $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model is a 1-matrix model of a Hermitian matrix $\Phi$ with interactions of $\Phi^4$ and $M\Phi^3$, where $M$ is some positive definite constant matrix, which is defined in detail in 1.2. Its perturbative theory is also carefully constructed in this paper since its interaction differs from a usual interaction of $\Phi^3$ because of $M$. On the other hand, this $M$ makes it possible to solve this theory rigorously.

Theories in which several potentials are mixed, such as $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model, are often studied in physics. For example, such mixtures of potentials like scalar $\phi^3$-$\phi^4$ theories appear in cosmology. It is known that the expansion of the universe is accelerating. The energy causing the expansion of the universe is called the cosmological constant. The cosmological constant is thought to correspond to the energy of the vacuum, but this is still unknown. Prior works have considered, for example, a massless minimally coupled quantum scalar field $V(\phi) = \lambda \phi^4/4! + \beta \phi^3/3!$ with asymmetric self-interactions ($\lambda > 0$), in a $(3 + 1)$-dimensional inflationary de Sitter space[2][3]. It has been suggested that evaluating vacuum expectation values of $V(\phi) = \lambda \phi^4/4! + \beta \phi^3/3!$ and $\phi$ in this spacetime can lead to screening of the
cosmological constant [2]. The renormalized vacuum expectation value of \( \phi \) is calculated by computing tadpoles in [2]. The vacuum expectation value of \( \phi^2 \) is also calculated in [3]. The model with \( \Phi^3 - \Phi^4 \) potentials constructed in this paper can be interpreted as quantum field theories on noncommutative spaces after taking a large \( N \) limit.

In addition, \( \phi^3 - \phi^4 \) potentials can appear when dealing with matrix models with several potentials mixed in. For example, in a limit where there is an effective potential of a gauge theory on a fuzzy sphere, \( \phi^3 \) and \( \phi^4 \) appear in a mixed form [7]. (Specifically, the phase transition of this matrix model is considered in a study of theoretical predictions and Monte Carlo simulations of the matrix model in [7].) This matrix model mixed with multiple potentials has also been applied in the phenomenology of particle physics.

Since a matrix model corresponding to a random triangulation of a 2-dimensional surface has a potential of a form \( \sum_{k=1}^{N} \Phi^k \) in general, \( \Phi^3 - \Phi^4 \) Hybrid-Matrix-Model can be considered a model whose potential is restricted to some cubic one and quartic one.

Recently, matrix models on noncommutative spaces with several potentials which are different from Grosse-Wulkenhaar model have also been studied. For example, one-matrix multitrace scalar matrix models have been studied in [29]. Thus, theories with several potentials have been the subjects of many important studies.

One matrix model for noncritical string theories and two-dimensional quantum gravity theories were well-studied in the 1980s and 1990s [9]. Each Feynman diagram in perturbative expansions of the matrix models represents a corresponding simplicial decomposition of a two-dimensional surface. In particular, two-dimensional surfaces are represented by \( \Phi^3 \) matrix model when considered as a graph discretized by a triangulation. The sum over two-dimensional surfaces corresponds to the two-dimensional quantum gravity theories. The proof of the Witten conjecture by Kontsevich can be cited as an example of a proof using \( \Phi^3 \) matrix model. Historically, Fukuma, Kawai, and Nakayama proved that the Virasoro constraint is equivalent to the condition that the solution of the KdV hierarchy satisfies the string equation [10][30]. Witten showed that the Witten-Kontsevich \( \tau \)-function satisfies the string equation [30][28]. Furthermore, Witten predicted that the Witten-Kontsevich \( \tau \)-function is the \( \tau \) function of the KdV hierarchy [30][28]. Finally, Kontsevich proved the Witten conjecture using \( \Phi^3 \) matrix model [30][24]. The quantum field theories on noncommutative spaces such as Moyal spaces gave a new perspective to matrix models. \( \Phi^3 \) matrix model as a renormalizable quantum field theory on Moyal spaces was first studied by Grosse and Steinacker [11][12][13]. The historical background of the studies is that the UV/IR mixing problem occurs and renormalization is not possible when considering quantum field theories on noncommutative spaces. To avoid the UV/IR mixing problem, Grosse and Steinacker adjusted the action of scalar \( \Phi^3 \) theories on Moyal spaces by adding harmonic oscillator potentials. In the following, Grosse-Steinacker \( \Phi^3 \) model is referred to as \( \Phi^3 \) matrix model. This model is renormalized by adding harmonic oscillator potentials to scalar \( \Phi^3 \) theories on Moyal spaces. In particular, all multipoint correlation function of \( \Phi^3 \) matrix model in the large \( N, V \) limit was computed by Grosse, Wulkenhaar, and one of the authors by solving exactly Schwinger-Dyson equations [15][16]. The multipoint correlation function in \( \Phi^4 \) matrix model here is the probability amplitude of a particle being observed at \( n \)-points, a physical quantity in quantum field theories. Subsequently, all the multipoint correlation functions of \( \Phi^3 \) matrix model in the case of finite degrees of freedom were computed by the authors [23].

A matrix model as a renormalizable \( \Phi^4 \) theory on Moyal spaces similar to \( \Phi^3 \) matrix model is Grosse-Wulkenhaar \( \Phi^4 \) model [18][14]. In the following, Grosse-Wulkenhaar \( \Phi^4 \) model is called \( \Phi^4 \) matrix model. This model corresponds to the quantum field theories on noncommutative spaces, which is renormalized by adding harmonic oscillator potentials to scalar \( \Phi^4 \) theories on Moyal spaces. This is how \( \Phi^4 \) matrix model came to be considered. The 2-point function of \( \Phi^4 \) matrix model whose Feynman diagrams in the perturbative expansion in the large \( N, V \) limit can be drawn in the planar diagrams was solved exactly by Grosse, Wulkenhaar, and Hock [17]. The multipoint correlation functions of \( \Phi^4 \) matrix model have been solved by Wulkenhaar and Hock [20]. Multipoint correlation function for \( \Phi^4 \) matrix model with nonplanar Feynman diagrams has been studied by Grosse, Wulkenhaar, Hock, and Branahl using a computational method called “Blobbed Topological Recursion” in [5][4][6][21]. Using the technology of topological recursion, a hybrid potential theory called \( \tau \)-spin model like the model of this paper is also studied in [1]. Recently, Prekrt, Ranković, Todorović-Vasović, Kováčik, and Tekel calculated the curvature contribution in Grosse-Wulkenhaar model [26]. Itzykson-Zuber integral is used to approximate the curvature contribution in Grosse-Wulkenhaar model [26]. The multitrace matrix model is approximated using analytical methods, and the multitrace matrix model is also studied numerically by Monte Carlo simulations in [26].
It is a well-known fact that $\Phi^3$ matrix model is integrable[24]. However, the integrability of the $\Phi^4$ matrix model as Grosse-Wulkenhaar model is not proved until now. Showing that $\Phi^3$-\Phi^4 Hybrid-Matrix-Model is finite and solvable may provide insight into the solvability of $\Phi^3$ matrix model. Therefore, to reveal properties of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model is significance.

In this paper, we construct Feynman rules of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model in a well-known way in terms of quantum field theories. The $\Phi^3$ interaction causes unconventional Feynman rules because of the insertion of $M$ as $\text{tr}M\Phi^3$. Therefore, we will discuss it carefully without omission. Particular attention is paid to the connected sum \( \sum_{i=1}^{\beta} N_i\)-point function $G_{[a_1^{N_1}]\cdots a_{N_B}^{b}}$. Its details are defined and discussed in 2.2, but this function can be interpreted geometrically and corresponds to the sum over all Feynman diagrams (ribbon graphs) drawn in certain rules on Riemann surfaces with $B$-boundaries (punctures). Each $[a_1^{N_1}]\cdots a_{N_B}^{b}$ corresponds to $N_i$ external lines coming from the $i$-th boundary (puncture) in the Feynman diagrams (ribbon graphs). First, using the Feynman rules of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model, perturbative expansions for one-point function $G_{[1]}$, two-point function $G_{[2]}$, and two-point function $G_{[2]}$ are computed by drawing Feynman diagrams for matrix size $N = 2$ case as pedagogical instructions to understand the way of calculations. Next, we perform perturbative calculations for $G_{[a_i]}G_{[ab]}$, and $G_{[a_i]}$ in the case that the matrix size is any $N$.

On the other hand, the calculation of the partition function $Z[J]$ in $\Phi^3$-\Phi^4 Hybrid-Matrix-Model can be carried out rigorously. For the computation of the partition function $Z[J]$, the integral of the off-diagonal elements of the Hermitian matrix is computed using Itzykson-Zuber integral[22][27][8][31]. In contrast, the integral of the diagonal elements of the Hermite matrix is obtained by using a function $P(z)$ that is similar to Pearcey integral. We then use the exact calculated partition function $Z[J]$ to compute the exact solutions for $G_{[a_i]}$, $G_{[a]}$, and $G_{[a]}$ for any $N$ matrix size. We verify that the final results of the perturbative expansions for $N = 2$ are in agreement with the saddle point approximation using the results of the exact solutions in $G_{[1]}$, $G_{[2]}$, and $G_{[2]}$ by setting $N = 2$. Finally, we make remarks about contributions from Feynman diagrams of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model corresponding to nonplanar or higher genus surfaces.

This paper is organized as follows. In Section 2, $\Phi^3$-\Phi^4 Hybrid-Matrix-Model is computed by perturbative expansion methods in ordinary quantum field theories. In Section 3, we compute the path integral of the partition function $Z[J]$. In Section 4, the results of Section 3 are used to compute exact solutions of one-point function $G_{[1]}$, two-point function $G_{[ab]}$, two-point function $G_{[ab]}$, and $n$-point function $G_{[a_1^{a_1}a_2^{a_2}\cdots a_n^{a_n}]}$. In Section 5, the exact solutions of 1-point function $G_{[1]}$, 2-point function $G_{[2]}$, and 2-point function $G_{[2]}$ for a matrix of size $N = 2$ are approximated using the saddle point method to verify that they are consistent with the perturbative expansion in Section 2. In Section 6, we remark contributions from Feynman diagrams of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model corresponding to nonplanar or higher genus surfaces.

1.2 Setup of $\Phi^3$-\Phi^4 Hybrid-Matrix-Model

In this subsection, we define $\Phi^3$-\Phi^4 Hybrid-Matrix-Model, and we determine our notations in this paper.

Let $\Phi = (\Phi_{ij})$ be a Hermitian matrix for $i, j = 1, 2, \ldots, N$ and $E_{m-1}$ be a discretization of a monotonously increasing differentiable function $e$ with $e(0) = 0$,

$$E_{m-1} = \mu^2 \left( \frac{1}{2} + e^{\frac{m-1}{\mu^2 V}} \right),$$  \hspace{1cm} (1.1)

where $\mu^2$ is a squared mass, and $V$ is a real constant. Let $E = (E_{m-1}\delta_{mn})$ be a diagonal matrix for $m, n = 1, \ldots, N$ and $M = (\sqrt{E_{k-1}\delta_{kl}})$ be a diagonal matrix for $k, l = 1, \ldots, N$, i.e. $E = M^2$. Let us consider the following action:

$$S[\Phi] = V \text{tr} \left( E\Phi^2 + \kappa\Phi + \frac{1}{2}M\Phi M\Phi + \sqrt{\lambda}\Phi^3 + \frac{\lambda}{4}\Phi^4 \right),$$  \hspace{1cm} (1.2)

where $\kappa$ is a constant (real), and $\lambda$ is a coupling constant that is non-zero real. To avoid confusion later, $\lambda$ and $V$ are assumed to be positive. When we consider the perturbation theory in Section 2, we put $\kappa = 0$. Let $J = (J_{mn})$ be a Hermitian matrix for $m, n = 1, \ldots, N$ as an external field. Let $D\Phi$ be the
integral measure,

\[ \mathcal{D}\Phi := \prod_{i=1}^{N} d\Phi_{ii} \prod_{1 \leq i < j \leq N} d\text{Re}\Phi_{ij} d\text{Im}\Phi_{ij}, \]  

(1.3)

where each variable is divided into real and imaginary parts \( \Phi_{ij} = \text{Re}\Phi_{ij} + i\text{Im}\Phi_{ij} \) with \( \text{Re}\Phi_{ij} = \text{Re}\Phi_{ji} \) and \( \text{Im}\Phi_{ij} = -\text{Im}\Phi_{ji} \). Let us consider the following partition function:

\[ Z[J] := \int \mathcal{D}\Phi \exp \left( -S[\Phi] + V\text{tr}(J\Phi) \right) \]

\[ = \int \mathcal{D}\Phi \exp \left( -V\text{tr} \left( E\Phi^2 + \kappa\Phi + \frac{1}{2} M\Phi M\Phi + \sqrt{\lambda} M\Phi^3 + \frac{\lambda}{4} \Phi^4 \right) \right) \exp \left( V\text{tr}(J\Phi) \right). \]  

(1.4)

## 2 Perturbation Theory of \( \Phi^3 - \Phi^4 \) Hybrid-Matrix-Model

The aim of this section is to understand \( \Phi^3 - \Phi^4 \) Hybrid-Matrix-Model by usual perturbative methods in field theories. For this purpose, we make its Feynman rules and calculate one-point functions and two types of two-point functions perturbatively. It is made in the same way as Feynman rules for well-known matrix models \cite{8,18}. However, it differs slightly from the usual one due to the presence of \( M \) found in (1.4). We then construct the perturbative theories a little more carefully for readers who are not familiar with perturbative theories of these matrix models.

### 2.1 Feynman Rules of \( \Phi^3 - \Phi^4 \) Hybrid-Matrix-Model \( (\kappa = 0) \)

We consider the theory of \( S_{\text{free}} = V\text{tr} \left( E\Phi^2 + \frac{1}{2} M\Phi M\Phi \right) \), that is no interaction theory, to consider the perturbation theory of \( \Phi^3 - \Phi^4 \) Hybrid-Matrix-Model at first. We calculate \( Z_{\text{free}}[J] \):

\[ Z_{\text{free}}[J] = \int \mathcal{D}\Phi \exp \left( -V\text{tr} \left( E\Phi^2 + \frac{1}{2} M\Phi M\Phi \right) \right) \exp \left( V\text{tr}(J\Phi) \right) \]

\[ = C' \exp \left( \frac{V}{2} \sum_{n,m=1}^{N} J_{mn} \frac{1}{E_{n-1} + E_{m-1} + \sqrt{E_{n-1} E_{m-1}}} \right). \]  

(2.1)

Here \( C' = Z_{\text{free}}[0] = \left( \prod_{n=1}^{N} \frac{2\pi}{3V E_{n-1}} \right) \left( \prod_{1 \leq n < m \leq N} \frac{\pi}{V(E_{n-1} + E_{m-1} + \sqrt{E_{n-1} E_{m-1}})} \right) \). We introduce the free \( N \)-point functions:

\[ \left\langle \prod_{k=1}^{n} \Phi_{i_k j_k} \right\rangle_{\text{free}} := \frac{1}{Z_{\text{free}}[0]} \int \mathcal{D}\Phi \left( \Phi_{i_1 j_1} \Phi_{i_2 j_2} \cdots \Phi_{i_n j_n} \right) \exp \left( -V\text{tr} \left( E\Phi^2 + \frac{1}{2} M\Phi M\Phi \right) \right) \exp \left( V\text{tr}(J\Phi) \right). \]  

(2.2)

In particular, the propagator is given as

\[ \left\langle \Phi_{ba} \Phi_{dc} \right\rangle_{\text{free}} = \frac{1}{V} \frac{\delta_{ad} \delta_{bc}}{E_{d-1} + E_{c-1} + \sqrt{E_{d-1} E_{c-1}}}. \]  

(2.3)

The Feynman graph of the propagator (ribbon) is then defined as follows:

\[ a \quad \overline{\quad \cdots \quad} \quad d = \left\langle \Phi_{ba} \Phi_{dc} \right\rangle_{\text{free}} = \frac{1}{V} \frac{\delta_{ad} \delta_{bc}}{E_{c-1} + E_{d-1} + \sqrt{E_{c-1} E_{d-1}}}. \]  

(2.4)

In this paper, we do not distinguish Feynman graphs from the functions (or operations) corresponding to the Feynman graphs, for simplicity. Next, we consider the case of (1.4) with the condition \( \kappa = 0 \). (1.4) can be written as follows:

\[ Z[J] = \int \mathcal{D}\Phi \exp \left( -S_{\text{int}}[\Phi] \right) \exp \left( -S_{\text{free}}[\Phi] \right) \exp \left( V\text{tr}(J\Phi) \right). \]  

(2.5)
Here $S_{\text{int}} = V \text{tr} \left( \frac{\lambda}{4} \Phi^4 + \sqrt{\lambda} M \Phi^3 \right)$. Using (2.5), as in ordinary field theory, if we consider the n-point function,

$$
\langle n \prod_{k=1}^{n} \Phi_{i_k,j_k} \rangle := \frac{1}{Z[0]} \int D\Phi \Phi_{i_1,j_1} \Phi_{i_2,j_2} \cdots \Phi_{i_n,j_n} \exp \left( -S_{\text{int}} [\Phi] \right) \exp \left( -S_{\text{free}} [\Phi] \right),
$$

then

$$
\langle n \prod_{k=1}^{n} \Phi_{i_k,j_k} \rangle := \frac{1}{Z[0]} \int D\Phi \frac{\partial}{\partial J_{i_1,j_1}} \frac{\partial}{\partial J_{i_2,j_2}} \cdots \frac{\partial}{\partial J_{i_n,j_n}} \exp \left( -S_{\text{int}} \left[ \frac{1}{V} \frac{\partial}{\partial J} \right] \right) \exp \left( -S_{\text{free}} [\Phi] \right) \exp \left( + V \text{tr} J \Phi \right) Z_{\text{free}}[J].
$$

From this, we also obtain the Feynman rule for interactions, which is as follows. First, we consider the three-point interactions. From $-V \text{tr} \sqrt{\lambda} M \Phi^3 = -V \sqrt{\lambda} \sum_{k,l,m} \sqrt{E_k - 1} \Phi_{kl} \Phi_{lm} \Phi_{mk}$, the vertex weight of the three-point interaction is determined:

$$
\begin{align*}
\sum_{v \in \{v_1, v_2, v_3\}} & \frac{i}{v_1} v_3 \frac{k}{v_2} j := \sum_{v \in \{i,j,k\}} \frac{i}{v_1} v_3 \frac{k}{v_2} j \\
& := \frac{i}{v_1} v_3 \frac{k}{v_2} j + \frac{i}{v_1} v_j \frac{k}{v_2} j + \frac{i}{v_1} v_j \frac{k}{v_3} j \quad (2.8)
\end{align*}
$$

The black dot $v$ corresponds to $\sqrt{E_{a-1}}$. Note that this Feynman rule corresponding interaction does not consider statistical factors. In other words, for all Wick contractions with $\text{tr} \sqrt{\lambda} M \Phi^3$, we shall add up all graphs with this weight. In this paper, we use the following notation:

$$
\sum_{v \in \{a,a,n\}} \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} := \sum_{v \in \{a,a,n\}} \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3}
$$

Next, we consider the four-point interactions. From $-V \text{tr} \frac{\lambda}{4} \Phi^4$, the vertex weight of the four-point interaction is obtained:

$$
\begin{align*}
\frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} \frac{v}{v_4} := & \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} \frac{v}{v_4} \\
& + \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} \frac{v}{v_4} \\
& + \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} \frac{v}{v_4} \\
& + \frac{i}{v_1} \frac{v}{v_2} \frac{k}{v_3} \frac{v}{v_4} \quad (2.9)
\end{align*}
$$

Note that this Feynman rule corresponding to this interaction does not consider statistical factors, too. For all Wick contractions with $\text{tr} \frac{\lambda}{4} \Phi^4$, we have to sum all terms with this weight.

For each loop, we add $\sum_{a=1}^{N} \sqrt{E_{a-1}}$ to sum over all elements. Note that summation $\sum_{a=1}^{N}$ should be carried out after multiplying $\sqrt{E_{a-1}}$ in (2.8) for each black dot in any loop. See the following examples:
\[
\begin{align*}
\frac{a}{a} & \quad n = -\sqrt{\lambda} \frac{1}{\sqrt{3} E_{a-1}^N \sum_{n=1}^{N} \frac{1}{E_{a-1} + E_{n-1} + \sqrt{E_{a-1} E_{n-1}}}}, \\
\frac{a}{a} & \quad n = -\sqrt{\lambda} \frac{\sqrt{E_{n-1}}}{\sqrt{3} E_{a-1} \sum_{n=1}^{N} \frac{E_{n-1}}{E_{a-1} + E_{n-1} + \sqrt{E_{a-1} E_{n-1}}}}, \\
\frac{b}{b} & \quad n = -\frac{\lambda}{4V^2(E_{a-1} + E_{b-1} + \sqrt{E_{a-1} E_{b-1}})^2 \sum_{n=1}^{N} \frac{1}{E_{b-1} + E_{n-1} + \sqrt{E_{b-1} E_{n-1}}}}.
\end{align*}
\]

\[\text{(2.11)}\]

\[\text{(2.12)}\]

\[\text{(2.13)}\]

2.2 Cumulant of $\Phi^3-\Phi^4$ Hybrid-Matrix-Model ($\kappa = 0$)

Using $\log \frac{Z[J]}{Z[0]}$, the $\sum_{i=1}^{B} N_i$-point function $G_{[a_1 \ldots a_{N_1} \ldots a_B \ldots a_{N_B}]}$ is defined as

\[
\log \frac{Z[J]}{Z[0]} := \sum_{B=1}^{\infty} \sum_{N_1 \leq \cdots \leq N_B} \sum_{p_1 = 1}^{N_B} V^{2-B} \frac{G_{[p_1 \ldots p_{N_1} \ldots p_{N_B}]} S(N_1, \ldots, N_B)}{S(N_1, \ldots, N_B)} \prod_{\beta=1}^{B} \nu_{\beta}^B, \quad \text{(2.14)}
\]

where $N_i$ is the identical valence number for $i = 1, \ldots, B$, $\nu_i := \prod_{j=1}^{N_i} \frac{1}{p_j p_{j+1}}$ with $N_i + 1 \equiv 1$, $(N_1, \ldots, N_B) = (N_1', \ldots, N_i', \ldots, N_B')$, and $S(N_1, \ldots, N_B) = \prod_{\beta=1}^{B} \nu_{\beta}^B$. The $\sum_{i=1}^{B} N_i$-point function denoted by $G_{[a_1 \ldots a_{N_1} \ldots a_B \ldots a_{N_B}]}$ is given by the sum over all Feynman diagrams (ribbon graphs) on Riemann surfaces with $B$-boundaries, and each $|a_1 \cdots a_{N_i}|$ corresponds to the Feynman diagrams having $N_i$-external ribbons from the $i$-th boundary. (See Figure 1.)
We give the reason why the Figure 1 picture for the Feynman diagram is obtained, in the following.

We define a $\sum_{i=1}^{B} N_i$-point cumulant which represent contributions of connected Feynman diagrams as

$$
\langle \Phi_a a_1 \cdots \Phi a_{N_1} a_1 \cdots \Phi a_{N_2} a_2 \cdots \Phi a_{N_B} a_1 \rangle_c := \frac{1}{V^{N_1+\cdots+N_B}} \partial \frac{1}{a_1} \cdots \partial \frac{1}{a_B} \log Z \bigg|_{J=0}. 
$$

Let us focus on a Feynman diagram with $N := \sum_{i=1}^{B} N_i$-external ribbons. Let $\Sigma$ be the number of loops contained in the Feynman diagram. Let $k_3$ and $k_4$ be the number of $V \text{tr} \left( \sqrt{M} \Phi^3 \right)$ interactions and the number of $V \text{tr} \left( \frac{1}{4} \Phi^4 \right)$ interactions in the Feynman diagram, respectively. The contribution from such Feynman diagram has $V^{k_3+k_4 - \frac{3k_3+4k_4+N}{2}}$, since the contribution from vertexes is $V^{k_3+k_4}$ and the contribution from propagators is $\left( \frac{1}{V} \right)^{\frac{3k_3+4k_4+N}{2}}$. Also, the Euler number of a surface with genus “$g$” and boundaries “$B$” is $\chi = 2 - 2g - B$. For this Feynman diagram, the corresponding Euler number is given by $\chi = (k_3 + k_4 + \mathcal{N}) - \frac{3k_3+4k_4+N}{2} + (N + \Sigma)$. Here $k_3 + k_4 + \mathcal{N}$ is the number of vertexes, $\frac{3k_3+4k_4+N}{2} + (N + \Sigma)$ is the number of the edges, and $(N + \Sigma)$ is the number of the faces in the Feynman diagrams. Note that we count one ribbon as one edge, here. Let us see the reason why the last $+\mathcal{N}$ of $\frac{3k_3+4k_4+N}{2} + (N + \Sigma)$ appears in the number of edge, and $\mathcal{N}$ also represents the number of faces. For example, we see the $i$-th boundary. There are $N_i$ faces touching one boundary, since there is $N_i$ external ribbons in the Feynman diagram from the term $\prod_{j=1}^{N_i} J_{p_j p_{j+1}}$ with $N_i + 1 \equiv 1$. (See Figure 2.)

Figure 1: The relationship between external ribbons of Feynman diagrams and boundaries as expressed in $G_{|a_1 \cdots a_{N_1}|}$

Figure 2: The relationship between external ribbons of Feynman diagrams and Boundary 1 as expressed in $G_{|a_1|}$
Therefore the number of all surfaces touching the boundary is \( \mathcal{N} = \sum_{i=1}^{B} N_i \) in this case, and \( \mathcal{N} \) edges appear as not ribbons but segments on boundaries. The contribution from the Feynman diagram has 
\[ V^{k_3+k_4-3k_3+4k_4-\mathcal{N}} = V^{X-\mathcal{N}+\Sigma} = V^{2-2g-\mathcal{N}+\Sigma} \]
So, we introduce \( G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \) for pairwise different \( a_j^i \) \((i=1,\ldots,B, \ j=1,\ldots,N_i)\) as in the following equation.

\[ \langle \Phi_{a_1^1} a_2^1 \cdots \Phi_{a_{N_1}^1} a_2^1 \cdots \Phi_{a_1^2} a_2^2 \cdots \Phi_{a_{N_2}^2} a_2^2 \cdots \Phi_{a_1^P} a_2^P \cdots \Phi_{a_{N_B}^P} a_2^P \rangle_c = V^{2-\mathcal{N}-B} G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P}. \]  

Let us check its consistency with (2.14). Note that

\[
\frac{1}{V^X} \frac{\partial^{\mathcal{N}}}{\partial J_{a_1^1} \cdots \partial J_{a_B^P}} \left( \sum_{i=1}^{\infty} \sum_{\beta=1}^{N_B} \frac{\partial^{\prime}}{\partial p_1^\beta \cdots p_{N_B}^\beta} G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \right)_{J=0} = \frac{1}{V^X} G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \times S(N_1,...,N_B).
\]

Then the \( \mathcal{N} \)-th derivative of the right-hand side of (2.14) with respect to \( J_{a_1^1}, \ldots, J_{a_B^P} \) is given by

\[
\frac{1}{V^X} \frac{\partial^{\mathcal{N}}}{\partial J_{a_1^1} \cdots \partial J_{a_B^P}} (R.H.S \ of \ (2.14)) = V^{2-\mathcal{N}-B} G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P},
\]

and the corresponding one from the left-hand side of (2.14) is given as

\[
\frac{1}{V^X} \frac{\partial^{\mathcal{N}}}{\partial J_{a_1^1} \cdots \partial J_{a_B^P}} (L.H.S \ of \ (2.14)) = \langle \Phi_{a_1^1} a_2^1 \cdots \Phi_{a_{N_1}^1} a_2^1 \cdots \Phi_{a_1^2} a_2^2 \cdots \Phi_{a_{N_2}^2} a_2^2 \cdots \Phi_{a_1^P} a_2^P \cdots \Phi_{a_{N_B}^P} a_2^P \rangle_c.
\]

Therefore, we found that (2.16) is consistent with (2.14) when all \( a_i^j \) are pairwise different.

If there is no condition that any two indexes do not much, then (2.16) is not necessarily correct. \( \langle \Phi_{a_1^1} a_2^1 \cdots \Phi_{a_{N_1}^1} a_2^1 \cdots \Phi_{a_1^2} a_2^2 \cdots \Phi_{a_{N_2}^2} a_2^2 \cdots \Phi_{a_1^P} a_2^P \cdots \Phi_{a_{N_B}^P} a_2^P \rangle_c \) might include contributions from several types of surfaces classified by their boundaries. For example, let us consider \( \langle \Phi_{aa} \Phi_{aa} \rangle_c \). From (2.14),

\[ \langle \Phi_{aa} \Phi_{aa} \rangle_c = \frac{1}{V^X} G_{\{aa\}} + \frac{1}{V^2} G_{\{a\}}. \]  

This means that \( \langle \Phi_{aa} \Phi_{aa} \rangle_c \) includes contributions from two types of surfaces which are surfaces with one boundary and ones with two boundaries.

From these observations, it is concluded that we should prepare a connected oriented surface with \( B \) boundaries for drawing each Feynman diagram to calculate \( G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \). We draw a Feynman diagram with external ribbons with \( (a_1^1 a_2^1), \ldots, (a_{N_1} a_1^1) \) subscripted to each boundary \( i \). For any connected segments in a Feynman diagram, both ends are on the same boundary \( G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \) is given by the sum over all such Feynman diagrams.

In addition, since it is 
\[ V^{k_3+k_4-3k_3+4k_4-\mathcal{N}} = V^{X-\mathcal{N}+\Sigma} = V^{2-2g-\mathcal{N}+\Sigma}, \]
we can consider “genus expansion” of \( G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \) like [19] as

\[ G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} = \sum_{g=0}^{\infty} V^{-2g} G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P}. \]  

We will discuss contributions from nontrivial topology surfaces in Section 6.

### 2.3 Perturbative Expansion of 1-Point Function \( G_{[1]} \), 2-Point Function \( G_{[2]} \), 2-Point Function \( G_{[2]} \) \((N = 2)\)

In order to familiarize readers with the perturbation calculations for \( G_{[a_1^1...a_{N_1}^1]|...|a_B^P...a_{N_B}^P} \), several specific example calculations are performed in this section. For simple exercises, \( N = 2 \) case is calculated in Subsection 2.3. In addition, a more simple \( N = 1 \) calculation is included in Appendix A.1.

The results obtained in Section 2.3 will be used in Section 5 as a check that the exact solutions are obtained correctly.
We calculate the 1-point function $G_{[1]}$ using perturbative expansion, at first. We compute each term of this expansion by drawing Feynman diagrams on surfaces with one boundary.

\[ G_{[1]} = \sum_{n=1}^{2} \sum_{v \in \mathcal{V}_n} n \sum_{v_1} + \mathcal{O}(\lambda \sqrt{\lambda}), \]  

(2.21)

where $\mathcal{V}_n = \{(1, 1, n)\}$. The circle around the Feynman diagram is the boundary. Feynman diagrams and each term of perturbative expansions have a one-to-one correspondence as follows:

\[ \sum_{n=1}^{2} \sum_{v \in \mathcal{V}_n} n \sum_{v_1} = -\frac{\sqrt{\lambda}}{V} \frac{\sqrt{E_0}}{3E_0^2} - \frac{\sqrt{\lambda}}{V} \frac{\sqrt{E_0}}{3E_0} \frac{1}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}} + \mathcal{O}(\lambda \sqrt{\lambda}). \]  

(2.22)

From this, $G_{[1]}$ becomes as follows:

\[ G_{[1]} = -\frac{\sqrt{\lambda}}{V} \frac{\sqrt{E_0}}{3E_0^2} - \frac{\sqrt{\lambda}}{V} \frac{\sqrt{E_0}}{3E_0} \frac{2}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}} - \frac{\sqrt{\lambda}}{V} \frac{\sqrt{E_1}}{3E_0} \frac{1}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}} + \mathcal{O}(\lambda \sqrt{\lambda}). \]  

(2.23)

Next, we calculate the 2-point function $G_{[21]}$ on surfaces with one boundary. We compute each term from the expansion of the 2-point function $G_{[21]}$ by drawing Feynman diagrams.

\[ G_{[21]} = V \sum_{a=2}^{2} \sum_{b=1}^{2} n \sum_{v_1} + 4V \sum_{n=1}^{2} \sum_{(i,j) \in \{(1,2),(2,1)\}} \sum_{v \in \{(1,1,n)\}} + \mathcal{O}(\lambda^2). \]  

(2.24)

The first diagram in (2.24) is given as follows:

\[ V \sum_{a=2}^{2} \sum_{b=1}^{2} n \sum_{v_1} = \frac{1}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}}. \]  

(2.25)
The second term in (2.24) is written as follows:

\[
4V \sum_{n=1}^{2} \sum_{(i,j) \in \{(1,2),(2,1)\}} \frac{1}{E_{i-1} + E_{j-1} + \sqrt{E_{i-1} E_{j-1}}} \left( \frac{1}{E_{i-1} + E_{n-1} + \sqrt{E_{i-1} E_{n-1}}} \right) \quad (2.26)
\]

The third term in (2.24) is expressed as follows:

\[
\frac{V}{2} \sum_{(i,j) \in \{(1,2),(2,1)\}} \sum_{n=1}^{2} \sum_{\omega \in \{(i,j,n)\}} \sum_{v \in \{(i,j,n)\}} \left( \frac{1}{E_{i-1} + E_{j-1} + \sqrt{E_{i-1} E_{j-1}}} \right)^2 \times \sqrt{E_{v-1}} \frac{1}{E_{i-1} + E_{n-1} + \sqrt{E_{i-1} E_{n-1}}} \left( \frac{1}{E_{j-1} + E_{n-1} + \sqrt{E_{j-1} E_{n-1}}} \right) \quad (2.27)
\]

The fourth term in (2.24) is given as follows:

\[
2 \times \frac{\lambda}{V} \sum_{(i,j) \in \{(1,2),(2,1)\}} \sum_{n=1}^{2} \sum_{\omega \in \{(i,j,n)\}} \sum_{v \in \{(i,j,n)\}} \frac{1}{3E_{i-1}} \left( \frac{1}{E_{i-1} + E_{j-1} + \sqrt{E_{i-1} E_{j-1}}} \right) \times \sqrt{E_{v-1}} \left( \frac{1}{E_{i-1} + E_{n-1} + \sqrt{E_{i-1} E_{n-1}}} \right) \quad (2.28)
\]

From (2.25)-(2.28), \( G_{[21]} \) is given as follows:

\[
G_{[21]} = \frac{1}{E_0 + E_1 + \sqrt{E_0 E_1}} + \frac{\lambda}{8\sqrt{E_0 E_1} \lambda} + \frac{3V}{3E_0 (E_0 + E_1 + \sqrt{E_0 E_1})^2} + \frac{\lambda}{3V E_1 (E_0 + E_1 + \sqrt{E_0 E_1})^2} + \frac{3V}{2\lambda E_0} + \frac{3V E_1 (E_0 + E_1 + \sqrt{E_0 E_1})^{3/2}}{8\sqrt{E_0 E_1} \lambda} + O(\lambda^2). \quad (2.29)
\]

Next, let us calculate the 2-point function \( G_{[21]} \) that has two boundaries using perturbative expansion. We compute each term of this expansion by drawing Feynman diagrams on surfaces with two boundaries.
In Subsection 2.3, we carried out the calculation for $G_{[1]} \equiv G_{N=2}$. In this section, we summarize the similar results for arbitrary $N$. The first diagram in (2.30) is given as follows:

\begin{equation}
G_{[2]} = 4V^2 + V^2 \sum_{\omega \in \{1,1,2\}} \sum_{\nu \in \{2,2,1\}} + \mathcal{O}(\lambda^2) \tag{2.30}
\end{equation}

There is a one-to-one correspondence between the Feynman diagram and each term in the perturbation expansion. The first diagram in (2.30) is given as follows:

\begin{equation}
G_{[2]} = \frac{\lambda}{9E_0E_1(E_0 + E_1 + \sqrt{E_0E_1})} \tag{2.31}
\end{equation}

The second term in (2.30) is obtained as follows:

\begin{equation}
V^2 \sum_{\omega \in \{1,1,2\}} \sum_{\nu \in \{2,2,1\}} \frac{5\sqrt{E_0E_1\lambda}}{9E_0E_1(E_0 + E_1 + \sqrt{E_0E_1})^2} + \frac{2\lambda}{9E_0(E_0 + E_1 + \sqrt{E_0E_1})^2} + \frac{2\lambda}{9E_1(E_0 + E_1 + \sqrt{E_0E_1})^2} \tag{2.32}
\end{equation}

From (2.31)-(2.32), $G_{[2]}$ becomes as follows:

\begin{equation}
G_{[2]} = \frac{4\sqrt{E_0E_1\lambda}}{9E_0E_1(E_0 + E_1 + \sqrt{E_0E_1})^2} + \frac{\lambda}{9E_0(E_0 + E_1 + \sqrt{E_0E_1})^2} + \frac{\lambda}{9E_1(E_0 + E_1 + \sqrt{E_0E_1})^2} + \mathcal{O}(\lambda^2). \tag{2.33}
\end{equation}

### 2.4 Perturbative Expansion of 1-Point Function $G_{[a]}$, 2-Point Function $G_{[ab]}$, 2-Point Function $G_{[a|b]}$}

In Subsection 2.3, we carried out the calculation for $G_{[1]}$, $G_{[2]}$, and $G_{[2]}$ perturbatively in the $N = 2$ case. In this section, we summarize the similar results for arbitrary $N$ case.

At first, we calculate the connected 1-point function $G_{[a]}$ using perturbative expansion.

\begin{equation}
G_{[a]} = \left. \frac{1}{V} \frac{\partial \log Z[J]}{\partial J_{aa}} \right|_{J=0}
= \frac{1}{Z[0]} \int \mathcal{D} \Phi \Phi_{aa} \left( \sum_{k=0}^{\infty} \frac{(-V\lambda)^k}{k!} \left( \sum_{n_1,n_2,n_3,n_4=1}^{N} \Phi_{n_1n_2n_3n_4} \Phi_{n_4n_1} \right)^k \right) \times \left( \sum_{l=0}^{\infty} \frac{(-V\sqrt{\lambda})^l}{l!} \left( \sum_{m_1,m_2,m_3,m_4=1}^{N} \sqrt{E_{m_1-1}\Phi_{m_1m_2}\Phi_{m_2m_3}\Phi_{m_3m_4}\Phi_{m_4m_1}} \right)^l \right) \exp \left( -V \text{tr} \left( E\Phi^2 + \frac{\lambda}{2} M\Phi M\Phi \right) \right)
= -V\sqrt{\lambda} \frac{Z_{\text{free}}[0]}{Z[0]} \sum_{m_1,m_2,m_3,m_4=1}^{N} \sqrt{E_{m_1-1}\Phi_{aa}\Phi_{m_1m_2}\Phi_{m_2m_3}\Phi_{m_3m_4}\Phi_{m_4m_1}} \text{free} + \mathcal{O}(\lambda\sqrt{\lambda}). \tag{2.34}
\end{equation}
We compute each term of this expansion by drawing perturbative expansions of the 1-point function $G_{[a]}$ in Feynman diagrams. The corresponding Feynman diagrams are drawn on oriented surfaces with one boundary with one connected ribbon graph inserted with an index “a”.

$$G_{[a]} = \sum_{n=1}^{N} \sum_{i \in V} \frac{a_i}{n!} + O(\lambda \sqrt{X})$$

$$= - \frac{\sqrt{X}}{3E_{a-1}V} \sum_{n=1}^{N} \sum_{i \in \{a,a,n\}} \sqrt{E_{n-1} - E_{a-1} + \sqrt{E_{a-1}E_{n-1}}} + O(\lambda \sqrt{X}). \quad (2.35)$$

Here $V = \{\{v_1, v_2, v_3\} \} = \{\{a, a, n\}\}$. The circle around the Feynman diagram in (2.35) represents the boundary. So the external lines (Ribbon) grow out of the circle.

Next, we calculate the 2-point function $G_{[ab]} (a \neq b)$ using perturbative expansion.

$$G_{[ab]} = \frac{1}{V} \frac{\partial^2 \log Z[J]}{\partial J_{ab} \partial J_{ba}} \bigg|_{J=0}$$

$$= \frac{V Z[0]}{Z[0]} \int D\Phi \Phi_{ab} \Phi_{ba} \left( \sum_{k=0}^{\infty} \frac{(-V \lambda)^k}{k!} \left( \sum_{n_1, n_2, n_3, n_4=1}^{N} \Phi_{n_1 n_2} \Phi_{n_2 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \right)^k \right)$$

$$\times \left( \sum_{l=0}^{\infty} \frac{(-V \sqrt{X})^l}{l!} \left( \sum_{m_1, m_2, m_3, m_4=1}^{N} \sqrt{E_{m_1 - 1} \Phi_{m_1 m_2} \Phi_{m_2 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1}} \right)^l \right) \exp \left( -V \text{tr} \left( E \Phi^2 + \lambda^2 M \Phi M \Phi \right) \right)$$

$$= \frac{V Z_{\text{free}}[0]}{Z[0]} \left\{ \langle \Phi_{ab} \Phi_{ba} \rangle_{\text{free}} + \frac{(-V \lambda)^1}{1!} \sum_{n_1, n_2, n_3, n_4=1}^{N} \langle \Phi_{ab} \Phi_{ba} \Phi_{n_1 n_2} \Phi_{n_2 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \rangle_{\text{free}} \right\}$$

$$+ \frac{(-V \sqrt{X})^2}{2!} \sum_{m_1, m_2, m_3, m_4, n_1, n_3, n_4=1}^{N} \sqrt{E_{m_1 - 1} E_{n_1 - 1} \Phi_{ab} \Phi_{ba} \Phi_{m_1 m_2} \Phi_{m_2 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \Phi_{n_1 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \rangle_{\text{free}} \right\}$$

$$+ O(\lambda^2). \quad (2.36)$$

We compute each term of (2.36) by drawing Feynman diagrams. The corresponding Feynman diagram should be a connected graph with two ribbon graphs with indices $a$ and $b$ inserted at two points from a single boundary:

$$G_{[ab]} = V \sum_{(i,j) \in \{(a,b),(b,a)\}} \sum_{n=1}^{N} v_i^{(i,j)} + 4V \sum_{(i,j) \in \{(a,b),(b,a)\}} \sum_{n=1}^{N} v_i^{(i,j)}$$

$$+ \frac{V}{2!} \sum_{(i,j) \in \{(a,b),(b,a)\}} \sum_{n=1}^{N} \sum_{\omega \in \mathbb{W}} \sum_{v \in V} \sum_{(i,j) \in \{(a,b),(b,a)\}} v_i^{(i,j)}$$

$$+ O(\lambda^2) \quad (2.37)$$

Note that “4” in the 2nd term and “2” in the 4th term are the statistical factors.
\[ G_{[ab]} = \frac{1}{E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}}} \]

\[ - \frac{\lambda}{V} \sum_{(i,j) \in \{(a,b),(b,a)\}} \sum_{n=1}^{N} \left( E_{i-1} + E_{j-1} + \sqrt{E_{i-1}E_{j-1}} \right)^2 \left( \frac{1}{E_{i-1} + E_{n-1} + \sqrt{E_{i-1}E_{n-1}}} \right)^2 \]

\[ \times \sqrt{E_{w-1}} \frac{1}{E_{i-1} + E_{n-1} + \sqrt{E_{i-1}E_{n-1}}} + \mathcal{O}(\lambda^2). \]  
(2.38)

**Remark.** We give reasons why a nonplanar Feynman diagram does not appear in (2.37). You might think that the Wick expansion of

\[ \sum_{n_1, n_2, n_3, n_4=1}^{N} \langle \Phi_{ab}^{\Phi_{n_1 n_2}} \Phi_{n_2 n_3}^{\Phi_{n_3 n_4}} \Phi_{n_3 n_4}^{\Phi_{n_4 n_1}} \rangle \]  

would yield a term like

\[ \sum_{n_1, n_2, n_3, n_4=1}^{N} \langle \Phi_{ab}^{\Phi_{n_1 n_2}} \Phi_{ba}^{\Phi_{n_3 n_4}} \Phi_{n_2 n_3}^{\Phi_{n_3 n_4}} \Phi_{n_4 n_1}^{\Phi_{n_4 n_1}} \rangle. \]  

In the corresponding Feynman diagram, it is like (2.39), but since \( b \) and \( a \) are connected by a line, \( \delta_{ab} \) is generated and 0 is obtained from \( a \neq b \).

(2.39)

As the third example, we calculate the 2-point function \( G_{[ab]}(a \neq b) \) using perturbative expansion. In this case, corresponding Feynman diagrams are drawn on surfaces with two boundaries like a cylinder. The external lines \( b \xrightarrow{a} a \) and \( \xrightarrow{b} b \) are grown out from different boundaries, respectively, and the two boundaries are not connected by any line in any non-zero Feynman diagram.

\[ G_{[ab]} = \frac{\partial^2 \log Z[J]}{\partial J_{aa} \partial J_{bb}} \bigg|_{J=0} \]

\[ = - \frac{1}{Z[0]} \left. \frac{\partial Z[J]}{\partial J_{aa}} \right|_{J=0} - \left. \frac{\partial Z[J]}{\partial J_{bb}} \right|_{J=0} + \left. \frac{1}{Z[0]} \frac{\partial^2 Z[J]}{\partial J_{aa} \partial J_{bb}} \right|_{J=0} \]

\[ = - \frac{V^2}{Z[0]^2} \int \mathcal{D}\Phi \left( \sum_{k=0}^{\infty} \frac{(-V\lambda)^k}{k!4^k} \left( \sum_{n_1, n_2, n_3, n_4=1}^{N} \Phi_{n_1 n_2} \Phi_{n_2 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \right)^k \right) \]

\[ \times \left( \sum_{l=0}^{\infty} \frac{(-V\sqrt{\lambda})^l}{l!} \right) \left( \sum_{m_1, m_2, m_3, m_4=1}^{N} \sqrt{E_{m_1-1}} \Phi_{m_1 m_2} \Phi_{m_2 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \right)^l \exp \left( -V \text{tr} \left( E\Phi^2 + \frac{\lambda}{2} M\Phi M\Phi \right) \right) \]

\[ \times \int \mathcal{D}\Phi \left( \sum_{k=0}^{\infty} \frac{(-V\lambda)^k}{k!4^k} \left( \sum_{n_1, n_2, n_3, n_4=1}^{N} \Phi_{n_1 n_2} \Phi_{n_2 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \right)^k \right) \]

\[ \times \left( \sum_{l=0}^{\infty} \frac{(-V\sqrt{\lambda})^l}{l!} \right) \left( \sum_{m_1, m_2, m_3, m_4=1}^{N} \sqrt{E_{m_1-1}} \Phi_{m_1 m_2} \Phi_{m_2 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \right)^l \exp \left( -V \text{tr} \left( E\Phi^2 + \frac{\lambda}{2} M\Phi M\Phi \right) \right) \]
\[ G_{a|b} = -\frac{V^2 Z_{free}[0]^2}{Z[0]^2} \times \left( -V \sqrt{\lambda} \right)^1 \sum_{m_1,m_3,m_4=1}^N \sqrt{E_{m_1-1}} \langle \Phi_{aa} \Phi_{m_1 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \rangle_{free} \]
\[ \times \left( -V \sqrt{\lambda} \right)^1 \sum_{m_1,m_3,m_4=1}^N \sqrt{E_{m_1-1}} \langle \Phi_{bb} \Phi_{m_1 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \rangle_{free} \]
\[ + \frac{V^2 Z_{free}[0]}{Z[0]} \left( \langle \Phi_{aa} \Phi_{bb} \rangle_{free} + \frac{(-V \lambda)^1}{14!} \sum_{n_1,n_2,n_3,n_4=1}^N \langle \Phi_{aa} \Phi_{bb} \Phi_{n_1 n_2} \Phi_{n_2 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \rangle_{free} \right) \]
\[ + \frac{(-V \sqrt{\lambda})^2}{2!} \sum_{m_1,m_3,m_4,n_1,n_3,n_4=1}^N \sqrt{E_{m_1-1}} \sqrt{E_{n_1-1}} \langle \Phi_{aa} \Phi_{bb} \Phi_{m_1 m_3} \Phi_{m_3 m_4} \Phi_{m_4 m_1} \Phi_{n_1 n_3} \Phi_{n_3 n_4} \Phi_{n_4 n_1} \rangle_{free} \]
\[ + O(\lambda^2). \quad (2.41) \]

We compute each term of this expansion by drawing Feynman diagrams.

\[ G_{a|b} = 4V^2 \sum_{\omega \in \mathcal{Y}} \sum_{v \in \mathcal{V}} + O(\lambda^2) \]
\[ = -\frac{\lambda}{9E_{a-1}E_{b-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})} + \frac{\sqrt{E_{a-1}E_{b-1}}}{9E_{a-1}E_{b-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})^2} \]
\[ + O(\lambda^2), \quad (2.42) \]

where \( \mathcal{V} = \{a, b\} \) and \( \mathcal{Y} = \{b, a\} \). More explicitly, this is rewritten as

\[ G_{a|b} = -\frac{\lambda}{9E_{a-1}E_{b-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})} + \frac{5\sqrt{E_{a-1}E_{b-1}}}{9E_{a-1}E_{b-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})^2} \]
\[ + \frac{2\lambda}{9E_{a-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})^2} + \frac{2\lambda}{9E_{b-1}(E_{a-1} + E_{b-1} + \sqrt{E_{a-1}E_{b-1}})^2} + O(\lambda^2). \quad (2.43) \]

## 3 Exact Calculation of Partition Function \( Z[J] \)

In this section, the calculation of the partition function is carried out rigorously for any \( N \). The flow of computations is similar to that of [20].

We introduce a new variable \( X \) by \( \Phi = X - \frac{1}{\sqrt{\lambda}} M \). Here \( X = (X_{mn}) \) is a Hermitian matrix, too. We do a change of variables of the integral measure \( D\Phi \) as \( d\Phi_{ij} = \sum_{m,n=1}^N \frac{\partial \Phi_{ij}}{\partial X_{mn}} dX_{mn} = dX_{ij} \). Then \( Z[J] \) is
given as

\[ Z[J] = \int \mathcal{D}\Phi \exp \left( -\mathcal{V} \left( E\Phi^2 + \kappa \Phi + \frac{3}{4} \Phi^4 + \sqrt{\lambda} M \Phi^3 + \frac{1}{2} M\Phi M\Phi \right) \right) \exp (\mathcal{V} \mathcal{F}(J\Phi)) \]

\[ = \exp \left( -\mathcal{V} \left( \frac{3}{4} M^3 - \frac{\kappa}{\sqrt{\lambda}} I + \frac{1}{\sqrt{\lambda}} J \right) \right) \int DX \exp \left( -\frac{\lambda\mathcal{V}}{4} \mathcal{F}(X^4) \right) \exp \left( \mathcal{V} \mathcal{F} \left( \left( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \right) X \right) \right). \tag{3.1} \]

Here \( I \) is the unit matrix. Note that \( x_i \) is the eigenvalues of the matrix \( X \) for \( i = 1, \ldots, N \), \( dU \) is the Haar probability measure of the unitary group \( U(N) \), and \( U \) is the unitary matrix which diagonalize \( X \)[8]. Then (3.1) can be rewritten as the following:

\[ Z[J] = \exp \left( -\mathcal{V} \left( \frac{3}{4} M^3 - \frac{\kappa}{\sqrt{\lambda}} I + \frac{1}{\sqrt{\lambda}} J \right) \right) \int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda\mathcal{V}}{4} x_i^4 \right) \right) \left( \prod_{1 \leq k < l \leq N} (x_l - x_k)^2 \right) \int_{U(N)} dU \exp \left( \mathcal{V} \mathcal{F} \left( \left( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \right) U\tilde{X}U^* \right) \right). \tag{3.2} \]

where \( \tilde{X} \) is the diagonal matrix \( \tilde{X} = U^*XU \). We use the following formula.

The Harish-Chandra-Itzykson-Zuber integral [22],[27],[31] for the unitary group \( U(n) \) is

\[ \int_{U(n)} \exp (t \mathcal{F}(AUBU^*)) dU = \frac{\det_{1 \leq i,j \leq n} (\exp (t\lambda_i(A)\lambda_j(B)))}{t^{n^2-n} \Delta(\lambda(A)) \Delta(\lambda(B))}. \tag{3.3} \]

Here \( A = (A_{ij}) \), and \( B = (B_{ij}) \) are some Hermitian matrices whose eigenvalues denoted by \( \lambda_i(A) \) and \( \lambda_i(B) \) \((i = 1, \ldots, n)\), respectively. \( t \) is the non-zero complex parameter, \( \Delta(\lambda(A)) := \prod_{1 \leq i < j \leq n} (\lambda_j(A) - \lambda_i(A)) \) is the Vandermonde determinant, and \( c_n := \left( \prod_{i=1}^{n} i! \right) \pi^{-\frac{n(n+1)}{4}} \) is the constant. \( (\exp (t\lambda_i(A)\lambda_j(B))) \)

is the \( n \times n \) matrix with the \( i \)-th row and the \( j \)-th column being \( \exp (t\lambda_i(A)\lambda_j(B)) \).

Applying the Harish-Chandra-Itzykson-Zuber integral (3.3) to \( \int dU \exp \left( \mathcal{V} \mathcal{F} \left( \left( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \right) U\tilde{X}U^* \right) \right) \) in (3.2), the result is

\[ \int_{U(N)} dU \exp \left( \mathcal{V} \mathcal{F} \left( \left( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \right) U\tilde{X}U^* \right) \right) = \frac{C}{N!} \prod_{1 \leq i < j \leq N} (x_j - x_i)^2 \prod_{i < j} (s_j - s_i)^2, \tag{3.4} \]

where \( s_t \) is the eigenvalues of the matrix \( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \) for \( t = 1, \ldots, N \) and \( C = \left( \prod_{p=1}^{N} p^l \right) \left( \frac{\pi}{N} \right)^{\frac{N(N-1)}{2}} \).

(\( \exp (Vx_is_j) \)) denotes the \( N \times N \) matrix with the \( i \)-th row and the \( j \)-th column being \( \exp (Vx_is_j) \). Then the partition function \( Z[J] \) is described as

\[ Z[J] = \frac{C}{N!} \exp \left( -\mathcal{V} \left( \frac{3}{4} M^3 - \frac{\kappa}{\sqrt{\lambda}} I + \frac{1}{\sqrt{\lambda}} J \right) \right) \prod_{1 \leq i < u \leq N} \frac{1}{(s_u - s_i)} \int \left( \prod_{j=1}^{N} dx_j \exp \left( -\frac{\lambda\mathcal{V}}{4} x_j^4 \right) \right) \left( \prod_{1 \leq k < l \leq N} (x_l - x_k) \right) \det \exp (Vx_is_j). \tag{3.5} \]
Let us transform the part of the $x_i$ integrations in (3.5). By definition of the determinant,
\[
\int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \right) \left( \prod_{1 \leq k < l \leq N} (x_l - x_k) \right) \det_{1 \leq i, j \leq N} \exp (V x_i s_j)
\]
\[= \sum_{\sigma \in S_N} \int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \right) \left( \prod_{1 \leq k < l \leq N} (x_l - x_k) \right) (-1)^{\sigma} \left( \prod_{j=1}^{N} \exp^{V x_{\sigma(j)}^4} \right).
\]
(3.6)

Here $S_N$ is a symmetric group. Next we changed variables as $x_{\sigma(i)} \mapsto x_i$ ($i = 1, \cdots, N$). Note that the Vandermonde determinant $\det \left( x_{\sigma(i)}^{j-1} \right) = (-1)^{\sigma} \det x_i^{j-1}$. The above is written as
\[
\int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \right) \left( \prod_{1 \leq k < l \leq N} (x_l - x_k) \right) (-1)^{\sigma} \left( \prod_{j=1}^{N} \exp^{V x_{\sigma(j)}^4} \right)
\]
\[= N! \int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \exp (V x_i s_i) \right) \prod_{1 \leq k < l \leq N} (x_l - x_k).
\]
(3.7)

From this, the partition function $Z[J]$ becomes as follows:
\[
Z[J] = C \exp \left( -V \text{tr} \left( \frac{3}{4\lambda} M^3 - \frac{\kappa}{\sqrt{\lambda}} I + \frac{1}{\sqrt{\lambda}} J \right) M \right) \prod_{1 \leq i < u \leq N} \frac{1}{(s_u - s_i)}
\]
\[\int \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \exp (V x_i s_i) \right) \prod_{1 \leq k < l \leq N} (x_l - x_k).
\]
(3.8)

Using $\prod_{1 \leq k < l \leq N} (x_l - x_k) = \det_{1 \leq i, j \leq N} \left( x_i^{j-1} \right)$, we calculate the remaining integral in the right-hand side in (3.5) as
\[
\int_{-\infty}^{\infty} \left( \prod_{i=1}^{N} dx_i \exp \left( -\frac{\lambda V}{4} x_i^4 \right) \exp (V x_i s_i) \right) \det_{1 \leq k, l \leq N} \left( x_i^{k-1} \right)
\]
\[= \sum_{\sigma \in S_N} \text{sgn} \sigma \prod_{i=1}^{N} \phi_{\sigma(i)}(s_i)
\]
\[= \det_{1 \leq i, j \leq N} (\phi_i(s_j)),
\]
(3.9)

where $\phi_k(z)$ is defined by
\[
\phi_k(z) = \int_{-\infty}^{\infty} dx \ x^{k-1} \exp \left( -\frac{\lambda V}{4} x^4 + V x z \right),
\]
(3.10)

and $(\phi_i(s_j))$ is the $N \times N$ matrix with the $i$-th row and the $j$-th column being $\phi(s_j)$. Summarizing the results (3.5) and (3.9), we obtain the following:

**Proposition 3.1.** Let $Z[J]$ be the partition function of $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model given by (1.4). Then, $Z[J]$ is given as
\[
Z[J] = C \exp \left( -V \text{tr} \left( \frac{3}{4\lambda} M^3 - \frac{\kappa}{\sqrt{\lambda}} I + \frac{1}{\sqrt{\lambda}} J \right) M \right) \prod_{1 \leq i < u \leq N} \frac{1}{(s_u - s_i)}
\]
\[\frac{\det_{1 \leq i, j \leq N} (\phi_i(s_j))}{\prod_{1 \leq i < u \leq N} (s_u - s_i)}.
\]

Note that $\phi_k(z)$ is expressed as
\[
\phi_k(z) = \left( \frac{V}{4} \right)^{k-1} \left( \frac{d}{dz} \right)^{k-1} \int_{-\infty}^{\infty} dx \exp \left( -\frac{\lambda V}{4} x^4 + V x z \right).
\]
(3.11)
We use
\[ P(z) = \int_{-\infty}^{\infty} dx \exp \left( -\frac{\lambda V}{4} x^4 + V x z \right). \] (3.12)

If \( V \) is a pure imaginary number, this \( P(z) \) is a special case of the following:
\[ P(x, y) := \int_{-\infty}^{\infty} dt \exp \left( i \left( t^4 + x t^2 + y t \right) \right). \] (3.13)

This is called Pearcey integral[25], where \( 0 \leq \arg x \leq \pi \) and \( y \in \mathbb{R} \). Substituting (3.12) for (3.11), \( \phi_k(z) \) is calculated as follows:
\[ \phi_k(z) = \left( \frac{1}{V} \right)^{k-1} \left( \frac{d}{dz} \right)^{k-1} P(z). \] (3.14)

**Proposition 3.2.** Let \( \left(P^{(j-1)}(s_i)\right) \) be the \( N \times N \) matrix with the \( i \)-th row and the \( j \)-th column being \( P^{(j-1)}(s_i) = \left( \frac{d}{ds_i} \right)^{j-1} P(s_i) \). We then obtain the following:
\[
\det \left( P^{(j-1)}(s_i) \right) = \left( \prod_{1 \leq i < j \leq N} (\partial_{s_i} - \partial_{s_j}) \right) P(s_1) \cdots P(s_N).
\]

This proposition is identical to Proposition 3.2 in [23] and its proof is also given in [23]. We introduce
\[
P_N(s_1, \ldots, s_N) = \left( \prod_{1 \leq i < j \leq N} (\partial_{s_i} - \partial_{s_j}) \right) P(s_1) \cdots P(s_N) = \det \left( \begin{array}{cc} P(s_1) & \cdots & P(s_N) \\ P^{(1)}(s_1) & \cdots & P^{(1)}(s_N) \\ \vdots & & \vdots \\ P^{(N-1)}(s_1) & \cdots & P^{(N-1)}(s_N) \end{array} \right).
\]

From this, \( \det \left( \phi_i(s_j) \right) \) is calculated as follows:
\[
\det \left( \phi_i(s_j) \right) = \frac{1}{V^{N(N-1)/2}} P_N(s_1, \ldots, s_N).
\] (3.16)

Summarizing the above results, we obtain the following:

**Theorem 3.3.** Let \( Z[J] \) be the partition function of \( \Phi^3 \cdot \Phi^4 \) Hybrid-Matrix-Model given by (1.4). Then, \( Z[J] \) is given as
\[
Z[J] = \int \mathcal{D}\Phi \exp \left( -V \text{tr} \left( E\Phi^2 + \kappa \Phi + \frac{\lambda}{4} \Phi^4 + \sqrt{\lambda} M \Phi^3 + \frac{1}{2} M \Phi M \Phi \right) \right) \exp \left( V \text{tr} \left( J\Phi \right) \right) = C' \left( \prod_{1 \leq t < u \leq N} \left( s_u - s_t \right) \right) \left( \prod_{1 \leq t < u \leq N} \left( s_u - s_t \right) \right), \] (3.17)

Here \( C' = \exp \left( -V \text{tr} \left( \frac{3}{4A} \lambda M^3 - \frac{k}{\sqrt{\lambda}} I \right) M \right) \left( \prod_{p=1}^{N} \left( \frac{\lambda}{N(N-1)} \right)^{\frac{N(N-1)}{2}} \right) \left( \prod_{p=1}^{N} \left( \frac{\lambda}{N(N-1)} \right)^{\frac{N(N-1)}{2}} \right) \), and \( s_t \) is the eigenvalues of the matrix
\[
\frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \text{ for } t = 1, \ldots, N.
\]

4 Exact Calculations of 1-Point Function \( G_{[a]} \), 2-Point Function \( G_{[ab]} \), 2-Point Function \( G_{[a]b} \), 2-Point Function \( G_{[a_1]a_2] \cdots a_n} \) \((3 \leq n)\)

In this section, \( G_{[a]} \), \( G_{[ab]} \), \( G_{[a]b} \), and \( G_{[a_1]a_2] \cdots a_n} \) are calculated exactly, by using Theorem 3.3.
4.1 1-Point Function \( G_{[a]} \)

In the calculation of the 1-point function \( G_{[a]} \), the external field \( J \) can be treated as the diagonal matrix \( J = \text{diag}(J_1, \cdots, J_N) \). Then the eigenvalues \( s_t \) in (3.17) is given as:

\[
G_{[a]} = \frac{1}{V} \frac{\partial}{\partial J_{aa}} \left. \left( e^{\frac{1}{\sqrt{\lambda}} \text{tr}(JM)} P_N(s_1, \cdots, s_N) \right) \right|_{J=0} = \frac{\partial}{\partial J_{aa}} \left. \left( e^{\frac{1}{\sqrt{\lambda}} \text{tr}(JM)} \prod_{1 \leq t < u \leq N} (s_u - s_t) P_N(s_1, \cdots, s_N) \right) \right|_{J=0}.
\] (4.1)

Note that

\[
\frac{\partial}{\partial J_{aa}} \left( e^{\frac{1}{\sqrt{\lambda}} \text{tr}(JM)} P_N(s_1, \cdots, s_N) \right) = -\frac{V}{\sqrt{\lambda}} e^{\frac{1}{\sqrt{\lambda}} \text{tr}(JM)} P_N(s_1, \cdots, s_N) + e^{\frac{1}{\sqrt{\lambda}} \text{tr}(JM)} (\partial_a P_N(s_1, \cdots, s_N)),
\] (4.2)

where \( \partial_a P_N(s_1, \cdots, s_N) = \frac{\partial}{\partial s_a} P_N(s_1, \cdots, s_N) \). Next, we use the following formula. Let \( \Delta = \Delta(\vec{x}_n) = \det 1_{1 \leq i, j \leq n} \left( (x_j)^{i-1} \right) \) be the Vandermonde determinant for \( \vec{x}_n = (x_1, \cdots, x_n) \in \mathbb{R}^n \). For any \( 1 \leq k \leq n \)

\[
\frac{\partial M_n}{\partial x_k} = \sum_{i=1, i \neq k}^n M_n(\vec{x}_n) \frac{x_k - x_i}{x_k - x_i}.
\] (4.3)

Using this formula, we get

\[
\frac{\partial}{\partial J_{aa}} \left( \prod_{1 \leq i, j \leq N} (s_j - s_i) \right) \bigg|_{J=0} = \frac{\partial}{\partial J_{aa}} \left( \det 1_{1 \leq i, j \leq N} \left( \left( \frac{E_{j-1} \sqrt{E_{j-1}}}{\sqrt{\lambda}} + J_{jj} - \kappa \right)^{i-1} \right) \right) \bigg|_{J=0}
\]

\[
= \sum_{i=1, i \neq a}^N \frac{\sqrt{\lambda} \det 1_{1 \leq i, j \leq N} \left( \left( \frac{E_{j-1} \sqrt{E_{j-1}}}{\sqrt{\lambda}} - \kappa \right)^{i-1} \right)}{E_{a-1} \sqrt{E_{a-1}} - E_{i-1} \sqrt{E_{i-1}}}. \] (4.4)

Substituting (4.4) into (4.1), finally \( G_{[a]} \) is expressed as

\[
G_{[a]} = -\frac{\sqrt{E_{a-1}}}{\sqrt{\lambda}} - \frac{1}{V} \sum_{i=1, i \neq a}^N \frac{\sqrt{\lambda}}{E_{a-1} \sqrt{E_{a-1}} - E_{i-1} \sqrt{E_{i-1}}} + \frac{1}{V} \partial_a \log P_N(z_1, \cdots, z_N),
\] (4.5)

where \( z_j = \frac{E_{j-1} \sqrt{E_{j-1}}}{\sqrt{\lambda}} - \kappa \) for \( j = 1, \cdots, N \), and \( \partial_a = \frac{\partial}{\partial z_a} \).

4.2 2-Point Function \( G_{[ab]} \)

Let us consider 2-point function \( G_{[ab]} \) \((a \neq b, a, b \in \{1, 2, \cdots, N\})\). For the calculation, we put \( J \) as all components without \( J_{ab}, J_{ba} \) are zero. Note that \( \text{tr}JM = 0 \) for this \( J \).

At first, we estimate eigenvalues \( s_t \) for \( t = 1, \cdots, N \) of the matrix \( \frac{1}{\sqrt{\lambda}} M^3 - \kappa I + J \). The eigenequation
is

\[
0 = \det \left( sI - \left( \frac{1}{\sqrt{\lambda}} M^2 - \kappa I + J \right) \right)
\]

\[
= \left( \prod_{i=1, i \neq a, b}^N \left( s - \frac{1}{\sqrt{\lambda}} E_{i-1} \sqrt{E_{i-1} + \kappa} \right) \right) \left\{ s^2 + \left( -\frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} + 2\kappa} - \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + 2\kappa} \right) s \right. \\
\left. - \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + \kappa} - \frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} + \kappa} + \frac{1}{\sqrt{\lambda}} E_{a-1} E_{b-1} \sqrt{E_{a-1} + \kappa}^2 - J_{ab} e_{ba} \right\}. 
\]

(4.6)

We label the eigenvalues as \( s_t = \frac{1}{\sqrt{\lambda}} E_{t-1} \sqrt{E_{t-1} + \kappa} \) for \( t \neq a, b \),

\[
s_a = \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + \kappa} + \frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} - 2\kappa} - \sqrt{\left( \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + \kappa} - \frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} + \kappa} \right)^2} + 4J_{ab} e_{ba}
\]

and

\[
s_b = \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + \kappa} + \frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} - 2\kappa} - \sqrt{\left( \frac{1}{\sqrt{\lambda}} E_{a-1} \sqrt{E_{a-1} + \kappa} - \frac{1}{\sqrt{\lambda}} E_{b-1} \sqrt{E_{b-1} + \kappa} \right)^2} + 4J_{ab} e_{ba}
\]

(4.7)

Let us calculate \( G_{ab} \) by using these \( s_t \). From Theorem 3.3,

\[
G_{ab} = \frac{1}{V} \frac{\partial^2 \log Z[J]}{\partial J_{ab} \partial J_{ba}} \bigg|_{J=0}
\]

\[
= \frac{1}{V} \frac{\partial^2}{\partial J_{ab} \partial J_{ba}} \left\{ \log P_N(s_1, \cdots, s_N) - \log \prod_{1 \leq t < u \leq N} (s_u - s_t) \right\} \bigg|_{J=0}
\]

\[
= \frac{1}{V} \left\{ \frac{\partial^2}{\partial J_{ab} \partial J_{ba}} P_N(s_1, \cdots, s_N) \bigg|_{J=0} - \frac{\partial^2}{\partial J_{ab} \partial J_{ba}} \left\{ \prod_{1 \leq t < u \leq N} (s_u - s_t) \right\} \bigg|_{J=0} \right\}. 
\]

(4.9)

Here we use

\[
\frac{\partial P_N(s_1, \cdots, s_N)}{\partial J_{ab}} \bigg|_{J=0} = \frac{\partial}{\partial J_{ab}} \left( \begin{array}{cccc} \det_{1 \leq k, l \leq N} (s_l^{k-1}) \\ \end{array} \right) \bigg|_{J=0} = 0, \text{ since } s_a \text{ and } s_b \text{ are functions of } (J_{ab}, J_{ba}) \text{ as we see in (4.7) and (4.8), then } \frac{\partial P_N(s_1, \cdots, s_N)}{\partial J_{ab}} \text{ and } \frac{\partial}{\partial J_{ab}} \left( \begin{array}{cccc} \det_{1 \leq k, l \leq N} (s_l^{k-1}) \\ \end{array} \right) \bigg|_{J=0} \text{ are of the form } J_{ba} \times (\cdots).
\]

Using the fact that \( \frac{\partial s_k}{\partial J_{ab}} \bigg|_{J=0} = 0 \) and

\[
\frac{\partial^2 s_a}{\partial J_{ba} \partial J_{ab}} \bigg|_{J=0} = \frac{\sqrt{\lambda}}{E_{a-1} \sqrt{E_{a-1} - E_{b-1} \sqrt{E_{b-1}}} - E_{a-1} \sqrt{E_{a-1} - E_{b-1} \sqrt{E_{b-1}}}} = - \frac{\partial^2 s_b}{\partial J_{ab} \partial J_{ba}} \bigg|_{J=0}, \text{ we obtain}
\]

\[
\frac{\partial^2}{\partial J_{ab} \partial J_{ba}} P_N(s_1, \cdots, s_N) \bigg|_{J=0} = \sqrt{\lambda} \frac{\partial}{\partial J_{ab}} \left( \begin{array}{cccc} \frac{\partial P_N(z_1, \cdots, z_N)}{\partial J_{ab}} - \frac{\partial P_N(z_1, \cdots, z_N)}{\partial J_{ba}} \\ \end{array} \right),
\]

(4.10)
where \( z_j = \frac{E_{j-1}\sqrt{E_{j-1}}}{\sqrt{\lambda}} - \kappa \) for \( j = 1, \ldots, N \). Similarly, we get

\[
\frac{\partial^2}{\partial J_{ab} \partial J_{ba}} \left\{ \prod_{1 \leq c \leq u \leq N} (s_u - s_t) \right\} \bigg|_{J=0} = \frac{(\sqrt{\lambda})^2}{E_{u-1} \sqrt{E_{u-1}} - E_{b-1} \sqrt{E_{b-1}}} \det_{1 \leq k, l \leq N} \left( (s_k)^{l-1} \right) \times \left( \sum_{i=1, i \neq a}^{N} \frac{1}{E_{a-1} \sqrt{E_{a-1}} - E_{i-1} \sqrt{E_{i-1}}} - \sum_{i=1, i \neq b}^{N} \frac{1}{E_{b-1} \sqrt{E_{b-1}} - E_{i-1} \sqrt{E_{i-1}}} \right),
\]

(4.11)

where we use the formula (4.3), again. Substituting (4.10) and (4.11) into (4.9), \( G_{[ab]} \quad (b < a, \text{i.e.} E_b < E_a) \) is finally obtained as

\[
G_{[ab]} = \frac{\sqrt{\lambda}}{V(E_{a-1} \sqrt{E_{a-1}} - E_{b-1} \sqrt{E_{b-1}})} \left\{ \frac{\partial_a P_N(z_1, \ldots, z_N)}{P_N(z_1, \ldots, z_N)} - \frac{\partial_b P_N(z_1, \ldots, z_N)}{P_N(z_1, \ldots, z_N)} \right\} - \sqrt{\lambda} \left( \sum_{i=1, i \neq a}^{N} \frac{1}{E_{a-1} \sqrt{E_{a-1}} - E_{i-1} \sqrt{E_{i-1}}} - \sum_{i=1, i \neq b}^{N} \frac{1}{E_{b-1} \sqrt{E_{b-1}} - E_{i-1} \sqrt{E_{i-1}}} \right).
\]

(4.12)

### 4.3 2-Point Function \( G_{[a|b]} \)

In the calculation of the 2-point functions \( G_{[a|b]} \), the external field \( J \) can be treated as the diagonal matrix \( J = \text{diag}(J_1, \ldots, J_N) \). Then the eigenvalues \( s_t \) in (3.17) is given \( s_t = \frac{E_{t-1} \sqrt{E_{t-1}}}{\sqrt{\lambda}} + J_{tt} - \kappa \) for \( t = 1, \ldots, N \). Then, the 2-point function \( G_{[a|b]} \) is calculated as follows:

\[
G_{[a|b]} = \frac{\partial^2 \log Z[J]}{\partial J_{ab} \partial J_{ba}} \bigg|_{J=0} = \frac{\partial^2}{\partial J_{ab} \partial J_{ba}} \left\{ \log P_N(s_1, \ldots, s_N) - \log \prod_{1 \leq c < u \leq N} (s_u - s_t) \right\} \bigg|_{J=0} = -\frac{\partial_a P_N(s_1, \ldots, s_N)}{P_N(s_1, \ldots, s_N)} \bigg|_{J=0} \frac{\partial_b P_N(s_1, \ldots, s_N)}{P_N(s_1, \ldots, s_N)} \bigg|_{J=0} + \frac{\partial_a \partial_b P_N(s_1, \ldots, s_N)}{P_N(s_1, \ldots, s_N)} \bigg|_{J=0} - \frac{\lambda}{(E_{a-1} \sqrt{E_{a-1}} - E_{b-1} \sqrt{E_{b-1}})^2},
\]

(4.13)

Finally \( G_{[a|b]} \) is expressed as

\[
G_{[a|b]} = -\frac{\partial_a P_N(z_1, \ldots, z_N) \partial_b P_N(z_1, \ldots, z_N)}{P_N(z_1, \ldots, z_N)} + \frac{\partial_a \partial_b P_N(z_1, \ldots, z_N)}{P_N(z_1, \ldots, z_N)} - \frac{\lambda}{(E_{a-1} \sqrt{E_{a-1}} - E_{b-1} \sqrt{E_{b-1}})^2},
\]

(4.14)

where \( z_j = \frac{E_{j-1} \sqrt{E_{j-1}}}{\sqrt{\lambda}} - \kappa \) for \( j = 1, \ldots, N \). \( \partial_a \) and \( \partial_b \) are given by

### 4.4 \( n \)-point function \( G_{[a^1|a^2|\ldots|a^n]} \quad (3 \leq n) \)

Let us calculate \( G_{[a^1|a^2|\ldots|a^n]} \) for \( 3 \leq n \). Here \( a^\beta \) is the pairwise different indices for \( \beta = 1, \ldots, n \). To calculate \( G_{[a^1|a^2|\ldots|a^n]} \), it is enough to take \( J \) as a diagonal matrix \( J = \text{diag}(J_1, \ldots, J_N) \). Then the eigenvalues \( s_t \) in (3.17) is given \( s_t = \frac{E_{t-1} \sqrt{E_{t-1}}}{\sqrt{\lambda}} + J_{tt} - \kappa \) for \( t = 1, 2, \ldots, N \). From the definition in (2.14), the \( n \)-point function \( G_{[a^1|a^2|\ldots|a^n]} \) is given by
The function under integration has three saddle points. We choose an integral path through one of them, for the case $z = C$ here can be evaluated as
\[ \kappa \text{ calculations are performed with } \] shall reproduce the contents of Section 2 by approximating the results of Section 4. Thereafter, the method 5 Approximations from Exact Solutions by Saddle point method
To ensure that perturbative calculations in Section 2 and exact results in Section 4 are consistent, we \[ z = \frac{E_{i-1} \sqrt{E_{i-1}}}{\sqrt{t}} + J_{tt} - \kappa, \] \[ \frac{\partial^3}{\partial J_{a_1} \partial J_{a_2} \partial J_{a_3}} \left( \sum_{1 \leq t < u \leq N} \log(s_u - s_t) \right) \bigg|_{J=0} = 0. \] In addition
\[ \frac{\partial^2}{\partial J_{a_1} \partial J_{a_2}} \log \exp \left( -\frac{V}{\sqrt{\lambda}} \text{tr} J M \right) = - \frac{\partial^2}{\partial J_{a_1} \partial J_{a_2}} \frac{V}{\sqrt{\lambda}} \sum_{t=1}^{N} J_{i t} \sqrt{E_{i-1}} = 0. \] (4.16)
Then, the $n$-point function $G_{a_1|a_2|...|a_n}$ ($3 \leq n$) is obtained as follows:
\[ G_{a_1|a_2|...|a_n} = V^{n-2} \frac{\partial^n}{\partial z_{a_1} \cdots \partial z_{a_n}} \log P_N(z_1, \cdots, z_N), \] (4.17)
where $z_i = \frac{E_{i-1} \sqrt{E_{i-1}}}{\sqrt{t}} - \kappa.$

5 Approximations from Exact Solutions by Saddle point method
To ensure that perturbative calculations in Section 2 and exact results in Section 4 are consistent, we shall reproduce the contents of Section 2 by approximating the results of Section 4. Thereafter, the calculations are performed with $\kappa = 0.$

By the change of variable $x = \left( \frac{V}{\lambda} \right)^{\frac{1}{4}} k$, $P(z) = \int_{-\infty}^{\infty} dx \exp \left( -\frac{V}{4} x^4 + Vxz \right)$ is transformed into
\[ P \left( \frac{z \lambda^{\frac{1}{4}}}{V^{\frac{1}{4}} \sqrt{2}} \right) = \frac{1}{\left( \frac{V}{\lambda} \right)^{\frac{1}{4}}} \int_{-\infty}^{\infty} dk \exp \left( -k^4 + zk \right). \] (5.1)
The function under integration has three saddle points. We choose an integral path through one of them, $k = \frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}}.$ To estimate the integral around the neighborhood of $k = \frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}}$ we put $k = \frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}} + \xi.$ Then (5.1) can be evaluated as
\[ P \left( \frac{z \lambda^{\frac{1}{4}}}{V^{\frac{1}{4}} \sqrt{2}} \right) = \frac{1}{\left( \frac{V}{\lambda} \right)^{\frac{1}{4}}} \int_{-\infty}^{\infty} d\xi \exp \left( - \left( \frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}} + \xi \right)^4 + z \left( \frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}} + \xi \right) \right) \]
\[ = C(z) \left( \frac{\sqrt{2}}{\lambda^{\frac{1}{4}} V^{\frac{1}{4}}} + \frac{7}{9 \times 2^{\frac{2}{4}} V^{\frac{1}{4}} \lambda^{\frac{1}{4}} z^{\frac{3}{4}}} + \frac{385}{648 \times 2^{\frac{2}{4}} \lambda^{\frac{1}{4}} V^{\frac{3}{4}} z^{\frac{7}{4}}} + O \left( \frac{1}{z^{\frac{7}{4}}} \right) \right). \] (5.2)
Here $C(z) = \frac{2^{\frac{3}{4}} \sqrt{\pi}}{\sqrt{3} \lambda^{\frac{1}{4}}} \exp \left( -\frac{z^{\frac{1}{4}}}{2^{\frac{1}{4}}} + \frac{z^{\frac{3}{4}}}{2^{\frac{3}{4}}} \right).$ To evaluate $n$-point functions, $z = \frac{\sqrt{2} V^{\frac{3}{4}} E_{i-1}^{\frac{1}{3}}}{\lambda^{\frac{1}{4}}}$ cases are used.

For the case $z_i = \frac{\sqrt{2} V^{\frac{3}{4}} E_{i-1}^{\frac{1}{3}}}{\lambda^{\frac{1}{4}}},$
\[ P\left(\frac{E_i - \sqrt{E_i - 1}}{\sqrt{\lambda}}\right) = C'(E_i) \left(\frac{\sqrt{2}}{\lambda^2 V^{\frac{3}{2}}} + \frac{7\lambda^2}{18\sqrt{2}E_i^{2}\lambda V^{\frac{3}{2}}} + \frac{385\lambda^5}{1296\sqrt{2}E_i^{6}\lambda V^{\frac{3}{2}}}\right) + O\left(\lambda^\frac{11}{4}\right), \quad (5.3) \]

where \( C'(E_i) = \sqrt{\frac{\pi\lambda^2}{3Vz^2 E_i}} \exp\left(\frac{3VE_i^2 - 1}{4\lambda}\right) \).

Next, we estimate \( \partial P(z) \), similarly. After changing variable as \( x = \frac{1}{\left(V\frac{\lambda}{4}\right)^\frac{3}{2}}k \),

\[ \partial P(z) = V\int_{-\infty}^{\infty} dx \; x \exp\left(-V\frac{\lambda}{4}x^4 + Vxz\right) \]

is transformed into

\[ (\partial P) \left(\frac{z\lambda^\frac{1}{2}}{V^\frac{1}{2}\sqrt{2}}\right) = \frac{V}{\left(V\frac{\lambda}{4}\right)^\frac{3}{2}} \int_{-\infty}^{\infty} dk \; k \exp\left(-k^4 + zk\right). \quad (5.4) \]

The saddle point on the integral path is \( k = \frac{z^\frac{1}{4}}{2^\frac{3}{4}} \). In the neighborhood of the saddle point \( k = \frac{z^\frac{1}{4}}{2^\frac{3}{4}} \) we put \( k = \frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi \), then (5.4) can be evaluated as

\[ (\partial P) \left(\frac{z\lambda^\frac{1}{2}}{V^\frac{1}{2}\sqrt{2}}\right) = \frac{V}{\left(V\frac{\lambda}{4}\right)^\frac{3}{2}} \int_{-\infty}^{\infty} d\xi \; \left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right) \exp\left(-\left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right)^4 + z\left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right)\right) \]

\[ = VC(z) \left(\frac{2^\frac{4}{3}z^\frac{1}{4}}{\sqrt{\lambda V}} - \frac{5}{18\sqrt{\lambda V}z} - \frac{455}{648 \times 2^\frac{3}{2}\sqrt{\lambda V}z^\frac{3}{2}}\right) + O\left(\frac{1}{z^{\frac{3}{4}}}\right). \quad (5.5) \]

For the case \( z_i = \frac{\sqrt{Vz^2 E_i^3}}{\lambda^\frac{3}{4}}, \)

\[ (\partial P) \left(\frac{E_i - \sqrt{E_i - 1}}{\sqrt{\lambda}}\right) = V C'(E_i) \left(\frac{\sqrt{2}Vz^2 E_i^3}{\lambda^2 V^{\frac{3}{2}}} - \frac{5\lambda^\frac{1}{2}}{18\sqrt{2}E_i^{2}\lambda V^{\frac{3}{2}}} - \frac{455\lambda^5}{1296\sqrt{2}E_i^{6}\lambda V^{\frac{3}{2}}}\right) + O\left(\lambda^\frac{11}{4}\right). \quad (5.6) \]

Next, we consider \( \partial^2 P(z) \). \( \partial^2 P(z) = V^2 \int_{-\infty}^{\infty} dx \; x^2 \exp\left(-V\frac{\lambda}{4}x^4 + Vxz\right) \)

is transformed similarly into

\[ (\partial^2 P) \left(\frac{z\lambda^\frac{1}{2}}{V^\frac{1}{2}\sqrt{2}}\right) = \frac{V^2}{\left(V\frac{\lambda}{4}\right)^\frac{3}{2}} \int_{-\infty}^{\infty} dk \; k^2 \exp\left(-k^4 + zk\right). \quad (5.7) \]

In the neighborhood of \( k = \frac{z^\frac{1}{4}}{2^\frac{3}{4}} \), (5.7) can be evaluated as

\[ (\partial^2 P) \left(\frac{z\lambda^\frac{1}{2}}{V^\frac{1}{2}\sqrt{2}}\right) = \frac{V^2}{\left(V\frac{\lambda}{4}\right)^\frac{3}{2}} \int_{-\infty}^{\infty} d\xi \; \left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right)^2 \exp\left(-\left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right)^4 + z\left(\frac{z^\frac{1}{4}}{2^\frac{3}{4}} + \xi\right)\right) \]

\[ = V^2 C(z) \left(\frac{2^\frac{7}{4}z^\frac{1}{4}}{3\lambda^\frac{3}{2}V^{\frac{3}{4}}z^\frac{3}{2}} + \frac{7}{27\lambda^\frac{3}{4}V^{\frac{3}{2}}z^\frac{1}{2}} - \frac{35\sqrt{2}}{1296\sqrt{2}\lambda^\frac{3}{2}V^{\frac{3}{4}}z^2} + \frac{1705}{648\sqrt{2}\lambda^\frac{3}{2}V^{\frac{3}{4}}z^2}\right) \]

\[ + O\left(\frac{1}{z^{\frac{3}{4}}}\right). \quad (5.8) \]

For the case \( z_i = \frac{\sqrt{Vz^2 E_i^3}}{\lambda^\frac{3}{4}}, \)

22
\[ (q^2 P) \left( \frac{E_{i-1} \sqrt{E_{i-1}}}{\sqrt{\lambda}} \right) = V^2 C'(E_0) \left( \frac{\sqrt{2E_{i-1}}}{\lambda^{\frac{3}{4}} V^\frac{1}{4}} - \frac{5}{18\sqrt{2}\lambda^{\frac{1}{4}} E_{i-1} V^\frac{3}{4}} + \frac{25\lambda^{\frac{3}{2}}}{1296\sqrt{2} E_{i-1}^3 V^\frac{7}{4}} \right) + O(\lambda^2). \]  

5.1 Approximation of 1-Point Function \( G_{[1]} \) by Saddle Point Method \((N = 2)\)

We consider the 1-point function \( G_{[1]} \) in the case of (4.5) in \( N = 2 \).

\[ G_{[1]} = - \frac{\sqrt{E_0}}{V} + \frac{1}{V} \log P_2(z_1, z_2) - \frac{1}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}}. \]  

\[ \text{(5.10)} \]

where \( z_1 = \frac{\sqrt{2V^\frac{3}{4}} E_0^{\frac{3}{2}}}{\lambda^{\frac{3}{4}}} \), and \( z_2 = \frac{\sqrt{2V^\frac{3}{4}} E_1^{\frac{3}{2}}}{\lambda^{\frac{3}{4}}} \). Using (5.3), (5.6) and (5.9), we approximate 1-Point Function \( G_{[1]} \) \((N = 2)\) as

\[ G_{[1]} = - \frac{\sqrt{E_0}}{V} + \frac{1}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} \]

\[ = - \frac{\sqrt{\lambda}}{V} P_2(z_1, z_2) \frac{\sqrt{E_0}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} - \frac{2}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} \]

\[ = - \frac{\sqrt{\lambda}}{V} P_2(z_1, z_2) \frac{\sqrt{E_0}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} - \frac{1}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} + O(\lambda \sqrt{\lambda}). \]

\[ \text{(5.11)} \]

This is consistent with the calculation of the 1-point function \( G_{[1]} \) \((N = 2)\) using perturbative expansion as (2.23) = (5.11).

5.2 Approximation of 2-Point Function \( G_{[2]} \) by Saddle Point Method \((N = 2)\)

We consider the 2-point function \( G_{[2]} \) in the case of (4.12) in \( N = 2 \).

\[ G_{[2]} = \frac{1}{V} \frac{\sqrt{E_0} \lambda}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}} + \frac{3V(\sqrt{E_1} - \sqrt{E_0})E_0 \sqrt{E_0}(E_1 \sqrt{E_1} - E_0 \sqrt{E_0})}{\sqrt{E_0} \lambda} - \frac{2}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} + O(\lambda^2). \]

\[ = \frac{1}{V} \frac{\sqrt{E_0} \lambda}{E_0 + E_1 + \sqrt{E_0 \sqrt{E_1}}} + \frac{3V(\sqrt{E_1} - \sqrt{E_0})E_0 \sqrt{E_0}(E_1 \sqrt{E_1} - E_0 \sqrt{E_0})}{\sqrt{E_0} \lambda} - \frac{2}{V} \frac{\sqrt{\lambda}}{E_0 \sqrt{E_0} - E_1 \sqrt{E_1}} + O(\lambda^2). \]

\[ \text{(5.13)} \]

This is consistent with the result of the 2-point function \( G_{[2]} \) \((N = 2)\) using perturbative expansion i.e. (2.29) = (5.13).
5.3 Approximation of 2-Point Function $G_{[2|1]}$ by the saddle point method $(N = 2)$

We consider the 2-point function $G_{[2|1]}$ in the case of (2.33) in $N = 2$.

$$G_{[2|1]} = -\frac{\partial_1 P_2(z_1, z_2) \partial_2 P_2(z_1, z_2)}{P_2(z_1, z_2)} + \frac{\partial_1 \partial_2 P_2(z_1, z_2)}{P_2(z_1, z_2)} - \frac{\lambda}{E_0^3 + E_1^3 - 2E_0 E_1 \sqrt{E_0 E_1}},$$

(5.14)

where $z_1 = \frac{\sqrt{2V^2 E_a^2}}{\lambda^\frac{3}{4}}$, and $z_2 = \frac{\sqrt{2V^2 E_b^2}}{\lambda^\frac{3}{4}}$. Using (5.3), (5.6) and (5.9), we approximate 2-Point Function $G_{[2|1]}$ $(N = 2)$ as

$$G_{[2|1]} = 4 \sqrt{E_0 E_1} \frac{\lambda}{9E_0 E_1(E_0 + E_1 + \sqrt{E_0 E_1})^2} + \frac{\lambda}{9E_0(E_0 + E_1 + \sqrt{E_0 E_1})^2} + \frac{\lambda}{9E_1(E_0 + E_1 + \sqrt{E_0 E_1})^2} + O(\lambda^2).$$

(5.15)

Then, we verified the consistency between the exact solution and the perturbative calculation for $G_{[2|1]}$ by (2.33) = (5.15).

6 Contributions from Non-trivial Topology Surfaces

In this section, we make remarks about contributions from Feynman diagrams corresponding to nonplanar or higher genus surfaces. As we saw in Section 2, perturbative expansions of $\Phi^3$-$\Phi^4$ Hybrid-Matrix-Model are given by the sum over not only planar but also non-planar Feynman diagrams. Nonplanar graphs are diagrams that cannot be drawn on a plane. For example, a nonplanar graph in Figure 3 appeared when the 2-point function $G_{[a|b]}$ was calculated.

![Figure 3: The surface of 2-point function $G_{[a|b]}$ with two boundaries](image)

Calculations in this paper are carried out for finite $N$, so nonplanar Feynman diagrams are taken into account.

Next, let us consider contributions from higher genus surfaces. Specifically, we consider “genus expansion” in one-point function $G_{[a]}$. First, we consider the contribution to the one-point function $G_{[a]}$ from a surface of one genus. (See Figure 4.)
\[
\gamma = \frac{\lambda \sqrt{\lambda}}{32 V^2 E_{a-1}} \sum_{v \in \{a,a,a\}} \sqrt{E_v}
\]

Figure 4: A surface for 1-point function \(G_{|a|}\) with one boundary and one genus

This diagram is constructed by using \(\Sigma = 0, k_3 = 1, k_4 = 1, \text{ and } \mathcal{N} = 1\), where we use the notation in Subsection 2.2. The contribution from the Feynman diagram has \(V^{k_3+k_4} - \frac{3k_3+4k_4+\mathcal{N}}{2} \) as we saw in Subsection 2.2. From this formula, \(V^{k_3+k_4} - \frac{3k_3+4k_4+\mathcal{N}}{2} = V^{1+1-\frac{2+4+1}{2}} = V^{-2}\). Also \(V^{k_3+k_4} - \frac{3k_3+4k_4+\mathcal{N}}{2} = V^{1-\mathcal{N} - \Sigma} = V^{2-2g-B-\mathcal{N}-\Sigma}\). From this, \(V^{2-2g-1-1-0} = V^{-2}\). It is consistent with Figure 4 that the genus of the surface is \(g = 1\).

Second, we consider the contribution for \(G_{|a|}\) from a two genus surface. (See Figure 5.)

\[
\gamma = \frac{\lambda^3 \sqrt{\lambda}}{16 \times 3^9 E_{a-1} V^4} \sum_{v,w,x \in \{a,a,a\}} \sqrt{E_v} \sqrt{E_w} \sqrt{E_x}
\]

Figure 5: The surface for 1-point function \(G_{|a|}\) with one boundary and two genus

From this diagram, we find that \(\Sigma = 0, k_3 = 3, k_4 = 2, \text{ and } \mathcal{N} = 1\). From them, \(V^{k_3+k_4} - \frac{3k_3+4k_4+\mathcal{N}}{2} = V^{3+2-\frac{9+8+1}{2}} = V^{-4}\). Also \(V^{k_3+k_4} - \frac{3k_3+4k_4+\mathcal{N}}{2} = V^{1-\mathcal{N} - \Sigma} = V^{2-2g-B-\mathcal{N}-\Sigma}\). On the other hand, Figure 5 implies \(V^{2-2g-1-1-0} = V^{-4}\). It is consistent with Figure 5 that the genus of the surface is \(g = 2\). These observations show that our calculations in Section 4 took into account any contributions from higher genus surfaces.

In other words, if we expand (4.5),(4.12),(4.14),(4.17), and so on as (2.20), then each \(G_{|a|}^{(g)}\) is obtained as the contribution from the fixed genus \(g\).

A Appendix
A.1 Calculation of Perturbative Expansion (\(N = 1\))
For \(N = 1\), we calculate the 1-point function \(G_{|1|}\) using perturbative expansion. For \(N = 1\), (2.34) is described as
\[ G_{[1]} = \frac{1}{V} \left( \frac{\partial}{\partial J} \right) \mid_{J=0} \]
\[ = \frac{1}{Z[0]} \int_{-\infty}^{\infty} dx \left( \sum_{k=0}^{\infty} \frac{(-V \lambda)^k}{k!4^k} x^{4k} \right) \left( \sum_{l=0}^{\infty} \frac{(-V)^l}{l!} \left( \sqrt{\lambda} \right)^l \left( \sqrt{E_0} \right)^l x^{3l} \right) \exp \left( -\frac{V^3}{2} E_0 x^2 \right) \]
\[ = \frac{1}{Z[0]} \int_{-\infty}^{\infty} \left( -V \sqrt{\lambda} \sqrt{E_0} \right)^3 x^4 \exp \left( -\frac{V^3}{2} E_0 x^2 \right) dx + \frac{V^2 \lambda \sqrt{\lambda} \sqrt{E_0}}{4Z[0]} \int_{-\infty}^{\infty} x^8 \exp \left( -\frac{V^3}{2} E_0 x^2 \right) dx \]
\[ + \frac{1}{Z[0]} \int_{-\infty}^{\infty} \left( -\frac{V \sqrt{\lambda} \sqrt{E_0}}{3!} \right)^3 x^{10} \exp \left( -\frac{V^3}{2} E_0 x^2 \right) dx + \mathcal{O}(\lambda^2 \sqrt{\lambda}). \] (A.1)

(A.1) is calculated directly as follows:
\[ G_{[1]} = \left( -\frac{\sqrt{E_0} \sqrt{\lambda}}{3V E_0} - \frac{\sqrt{E_0} \lambda \sqrt{\lambda}}{36V^2 E_0^3} + \frac{5\sqrt{E_0} \lambda \sqrt{\lambda}}{54V^2 E_0^3} \right) + \frac{35\sqrt{E_0} \lambda \sqrt{\lambda}}{108V^2 E_0^3} + \frac{35 \sqrt{E_0} \lambda \sqrt{\lambda}}{54V^2 E_0^3} + \mathcal{O}(\lambda^2 \sqrt{\lambda}) \]
\[ = -\frac{\sqrt{\lambda}}{3V E_0 \sqrt{E_0}} - \frac{7 \lambda \sqrt{\lambda}}{27V^2 E_0^3} + \mathcal{O}(\lambda^2 \sqrt{\lambda}). \] (A.2)

Similar to Section 5 this result is verified from the exact solution of \( G_{[1]} \) for \( N = 1 \) that is given in A.2.

A.2 Approximation of 1-Point Function \( G_{[1]} \) by Saddle Point Method \( (N = 1) \)

We consider the 1-point function \( G_{[1]} \) in the case of (4.5) in \( N = 1 \).
\[ G_{[1]} = -\frac{\sqrt{E_0}}{\sqrt{\lambda}} + \frac{1}{V} \frac{\partial}{\partial \lambda} P_1(z_1), \] (A.3)
where \( z_1 = \frac{\sqrt{2} \frac{V^2}{E_0} \frac{E_0^3}{\lambda^2}}{3V E_0 \sqrt{E_0}} \), and \( z_2 = \frac{\sqrt{2} \frac{V^2}{E_0} \frac{E_0^3}{\lambda^2}}{12V E_0 \sqrt{E_0}} \). Using (5.3) and (5.6), we approximate 1-Point Function \( G_{[1]} \) (\( N = 1 \)) as
\[ G_{[1]} = -\frac{\sqrt{E_0}}{\sqrt{\lambda}} + \frac{1}{V} \frac{\partial}{\partial \lambda} P_1(z_1) \]
\[ = -\frac{\sqrt{\lambda}}{3V E_0 \sqrt{E_0}} - \frac{7 \lambda \sqrt{\lambda}}{27V^2 E_0^3} + \mathcal{O}(\lambda^2 \sqrt{\lambda}). \] (A.4)

This is consistent with the calculation of 1-point function \( G_{[1]} \) (\( N = 1 \)) using perturbative expansion i.e. (A.2) = (A.4).
